Frequently Asked Questions

JatayuOS 0.1 Release Candidate | Offline help | 1 October 2026

What is JatayuOS?

An independent Debian 13 desktop with KDE Plasma, Firefox ESR, LibreOffice and Jatayu applications. Created by Anup Yadav, with an India-first project identity and global open-source foundations.

Is this the final version?

No. This is a Release Candidate for testing. Development Preview wording has been retired from the desktop, but final-release validation is still required.

Why the name JatayuOS?

The name draws on Jatayu's courage, service and protection in the Ramayana. It expresses the project's intended identity without claiming institutional endorsement.

What does Made in India mean?

It refers to the origin of the JatayuOS project and its distribution work. Debian, Linux, KDE and other upstream components come from international communities.

Do I need internet to install?

The candidate includes an offline installation path. Internet is needed for updates, online services, extra software and Android image setup. Test offline installation in a disposable VM first.

Does installation erase files?

Erase-disk installation deletes the selected disk's data. Other partition changes can also cause data loss. Back up your files and read Calamares' final summary before confirming.

Does the live session save my changes?

Do not rely on persistence. An ordinary live session loses settings when restarted. Save important files to a separate device or complete installation.

Desktop and Jatayu apps

Where are Firefox and LibreOffice?

Firefox ESR is pinned to the panel and listed in the menu. LibreOffice applications are in the Office category. Aarambh links to everyday apps and settings.

Why does Dolphin show only Home?

Check that Places is visible and standard folders exist. This candidate creates the standard directories before Aarambh opens and leaves the KDE Places model native. You may add folders to Places yourself; existing bookmarks are not reset.

How do I stop Aarambh opening at sign-in?

Clear Show Aarambh when I sign in, then close the app. Reopen Aarambh from the menu to enable it again.

Where is Wallpaper Changer?

Open Jatayu Tools or Aarambh. Version 1.2.1 includes 24 offline scenes, favourites and rotation. Choose a screen and apply a wallpaper. Rotation still needs testing through logout/login on the target Plasma desktop.

Are the wallpapers real photographs?

No. They are AI-generated artistic scenes. Full HD describes their exported 1920 x 1080 dimensions. Location labels do not guarantee geographic accuracy.

Do Sarkar Setu and Kavach store my passwords?

Their wrappers open external links in Firefox and do not implement government account login. The linked sites and browser have their own handling of credentials and personal data. Review each service's address and privacy policy.

Is Kavach a security certificate?

No. It is a local dashboard with system actions. Effective firewall, update and backup behaviour must be checked on the installed system.

How do I get Hindi typing?

Use KDE regional/keyboard settings and Fcitx5 Configuration. Add the desired input method. On Wayland, review KDE's Virtual Keyboard selection. Sign out and back in if needed.

Android, updates and support

Can Android apps run immediately?

Waydroid is included, but Android system/vendor images require a separate initial download. A compatible Wayland session, binder support and graphics are required. App compatibility is not universal.

Are Play Store and Google apps included?

No. Google apps, Play Store and ARM translation libraries are not bundled. Follow official Waydroid guidance and the terms of any additional software you choose.

How do I update JatayuOS?

Use Discover for Debian package updates. The candidate has no published signed Jatayu repository. Downloading a new ISO does not update an installed system.

Is Secure Boot supported?

This candidate does not claim certified Secure Boot compatibility. Record firmware settings when testing BIOS and UEFI boot.

Does a precheck PASS mean everything works?

It confirms required source files, package integrity, declared package availability and dependency checks for the build. It does not replace boot, installer, desktop or hardware testing.

Where are credits and licences?

Open About JatayuOS or page 7 of the User Manual. Installed notices are under /usr/share/doc; the build manifest identifies exact shipped packages and source versions.

Can I redistribute this ISO publicly?

The candidate is for project testing. Public distribution needs a completed licence, trademark/artwork and corresponding-source review. Including credits alone does not satisfy every redistribution requirement.

How do I report a problem?

Contact jatayuos4u@gmail.com with the ISO checksum, device/VM details, exact steps and reviewed logs. Do not include passwords or private account data.
